

A large, faint watermark of the University of Copenhagen seal is visible in the background. It features a central figure, likely a king or saint, wearing a crown and holding a scepter. The figure is surrounded by a circular border containing Latin text, including "SIGILLUM UNIVERSITATIS COPENHAGENSIS".

# Text Slide

In 1853, Verdi composed *La Traviata*, inspired by Alexandre Dumas' novel *La Dame aux camélias*, based on the life of the courtesan Marie Duplessis. Both the novel and Verdi's opera have since inspired countless interpretations.

The downfall of a woman and her perceived lack of a moral compass have long captivated audiences. Violetta, a celebrated courtesan, moves effortlessly through high society, embracing her independence and relishing her freedom. Yet beneath her glamorous exterior, she is gravely ill.

When she meets the poet Alfredo, Violetta experiences true, unconditional love for the first time. She falls for him, and together they escape to a country estate, far from society's judgment and expectations. But their happiness is short-lived. One day, Alfredo's father visits Violetta, insisting that her relationship with his son is tarnishing the family's reputation. Persuaded by his plea, she makes the painful decision to leave Alfredo, writing him a farewell letter. Heartbroken, she returns to the city and resumes her life as a courtesan. Enraged and bewildered, Alfredo cannot understand her choice—until it is too late.

# Quotes

*Our posturings, our imagined self-importance, the delusion that we have some privileged position in the Universe, are challenged by this point of pale light. Our planet is a lonely speck in the great enveloping cosmic dark. In our obscurity, in all this vastness, there is no hint that help will come from elsewhere to save us from ourselves.*

*The Earth is the only world known so far to harbor life. There is nowhere else, at least in the near future, to which our species could migrate. Visit, yes. Settle, not yet. Like it or not, for the moment the Earth is where we make our stand.*

*It has been said that astronomy is a humbling and character-building experience. There is perhaps no better demonstration of the folly of human conceits than this distant image of our tiny world. To me, it underscores our responsibility to deal more kindly with one another, and to preserve and cherish the pale blue dot, the only home we've ever known.*

Carl Sagan, Pale Blue Dot: A Vision of the Human Future in Space

# Nested Quotes

*Friedrich Nietzsche, in Thus Spoke Zarathustra, often used the character of Zarathustra to explore profound ideas about perspective, self-overcoming, and the human condition. One notable reflection touches upon how enlightenment or a higher state of being might appear to those who remain unenlightened:*

*The higher we soar the smaller we appear to those who cannot fly.*

Thus Spoke Zarathustra

*This aphorism suggests the loneliness and misunderstanding that can accompany intellectual or spiritual elevation.*

# List (Unordered)

This is a list:

- First-level bullet
  - Second-level bullet
    - ▶ Third-level bullet
    - ▶ Another third-level bullet
      - ▷ Fourth-level bullet
  - Another second-level bullet
- Another first-level bullet

# Equations

The multivariate normal distribution is said to be "non-degenerate" when the symmetric covariance matrix  $\Sigma$  is positive definite. In this case the distribution has density:

$$f_{\mathbf{X}}(x_1, \dots, x_k) = \frac{\exp\left(-\frac{1}{2}(\mathbf{x} - \boldsymbol{\mu})^T \Sigma^{-1} (\mathbf{x} - \boldsymbol{\mu})\right)}{\sqrt{(2\pi)^k |\Sigma|}}$$

where  $x$  is a real  $k$ -dimensional column vector and  $|\Sigma| \equiv \det \Sigma$  is the determinant of  $\Sigma$ , also known as the generalized variance. The equation above reduces to that of the univariate normal distribution if  $\Sigma$  is a  $1 \times 1$  matrix (i.e., a single real number).
